Soil Conditioner and Amendment Technologies

Volume 1 - (1995)
&
Volume 2 - (1997)

WHY USE SOIL CONDITIONERS AND AMENDMENTS

It has been said that good soil and bad plants beat bad soil and good plants anytime. Information in *Soil Conditioner and Amendment Technologies* can help to make poor soils become better.

Soil is not really renewable in our lifetime and beyond. It must be cared for to not only maximize output or maximize other values within reason, but also to make it possible (or not make it impossible) for those of future generations to obtain similar benefits from the land. Ownership of land, therefore, is quite different from other kinds of ownership. Soil has to last into perpetuity.

Soil is usually subject to many severe problems which require the use of various conditioners/amendments to keep it tillable, fertile, nutritionally and biologically healthy, and also to prevent it from loss by various kinds of erosion. In many ways, wise use of soil conditioners/amendments can be very worthwhile. They do not degrade soils and their value is often long term.

Soil Conditioner and Amendment Technologies is a series of books on the important topic of soil conditioners and amendments. Soil conditioners and amendments influence both the nutrient and physical characteristics of the soil. The objective of this series is to fill the gap in the world literature on information which concerns soil improvement. While there is extensive information on other limiting factors for plant growth, soil physical conditions have been extensively neglected. Poor physical properties of soil are often the major limiting factor to plant growth. *Soil Conditioner and Amendment Technologies* addresses this important issue with current and in-depth information on this important topic.
